

SDRAM DDR3 256MX8 ½ Density Device Technical Note

Introduction

This technical note provides an overview of how the SGG128M8V79DG8GQF-15E DDR3 SDRAM device is configured and tested as a 1Gb device.

This device is internally configured as a standard 128MX8 JEDEC standard device.

Addressing

Parameter	2Gb ½ Density Device Configuration 128M X8	2Gb Device Configuration for reference only 256M X 8
Configuration	16MEG X 8 X 8 Banks	32MEG X 8 X 8 banks
Refresh count	8K	8K
Row addressing	16K A0-A13	32K A0-A14
Bank addressing	8: BA0-BA2	8: BAO-BA2
Column addressing	1K A0-A9	1K A0-A9

Spectek Component Part Options and Designations

Options	Designation
Spectek Memory	SGG Spectek Component sales
Component depth	128MEG
Component width	x8
Design ID	V79D (1/2 density device)
Operating voltage	1.5V
Refresh	8: 8K
Component package type:	GQ: 78/117B 8x10.5MM
Material type	F: LEAD-FREE
Device speed	-15E 1333MHz 9-9-9-1.5V

Pin Descriptions

Symbol	Type	Description
A0-A13	Input	Address inputs: Provide the row address for ACTIVE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BA[2:0]) or all banks (A10 HIGH). The address inputs also provide the op-code during a LOAD MODE command. Address inputs are referenced to Vrefca. A12: When enable in the mode register (MR), A12 is sampled during READ and WRITE commands to determine whether burst chop (on-the-fly) will be performed (HIGH = BL8 or no burst chop, LOW = BC4)
BA0-BA2	Input	Bank address inputs: Define the device bank to which an ACTIVE, READ, WRITE, or PRECHARGE command is being applied. BA[2:0] define which mode register (MRO, MR1, MR2 or MR3) is loaded during the LOAD MODE command. BA[2:0] are reference to Vrefca
CKx CKx#	Input	Clock: Differential clock inputs. All control command and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#. Output data strobe (DQS, DSS#) is referenced to crossings of CK and CK#.
CKEx	Input	Clock enable: Enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM.
CS#	Input	Chip select: CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external bank selection on systems with multiple ranks. CS# is considered part of the command code.
DM	Input	Data mask (x8 devices only): DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with the input data during a write access. Although DM pins are input-only, DM loading is designed to match that of the DQ and DQS pins.
ODT	Input	On-die termination: Enables (registered HIGH) and disables (register LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to the following pins: DQ, DQS, DQS#, DM and CB. The ODT input will be ignored if disabled via the LOAD MODE command.
RAS#, CAS#, WE#	Input	Command inputs: RAS#, CAS# and WE# (along with CS#) define the command being entered.
RESET#	Input	Reset: RESET# is an active LOW CMOS input referenced to Vss. The RESET# input receiver is a CMOS input defined as a rail-to rail signal with DC HIGH $\geq 0.8 \times V_{dd}$ and DC LOW $\leq 0.2 \times V_{dd}$. RESET# assertion and deseerion are asynchronous.
DQ0- DQ7	I/O	Data input/output: Bidirectional data bus.
DQS DQS#	I/O	Data strobe: Differential data strobes. Output with read data: edge-aligned with read data: input with read data: input with write data: center-aligned with write data

Pin Descriptions - Continued)

Symbol	Type	Description
TDQS TDQSx#	Output	Termination data strobe (x8 devices only) When TDQS is enabled, DM is disabled and TDQS and TDQS# provide termination resistance.
Vdd	Supply	Power Supply: 1.5V \pm 0.1V.
VddQ	Supply	DQ Power Supply: 1.5V \pm 0.1V Isolated on the device for improved noise immunity.
Vddrefca	Supply	Reference voltage for control, command and address: Vrefca must be maintained at all times (including self refresh) for proper device operation.
Vrefdq	Supply	Reference voltage for data: Vrefdq must be maintained at all times (excluding self refresh) for proper device operation.
Vss	Supply	Ground
VssQ	Supply	DQ ground: Isolated on the device for improved noise immunity.
ZQ	Reference	External reference ball for output drive calibration: This ball is tied to an external 240 ohm resistor (RZQ) which is tied to Vssq.
NC	-	No connect: These pins are not connected on the module
NF	-	No function: These pins are connected within the module, but provide no functionality.
